Linking statt unlinking

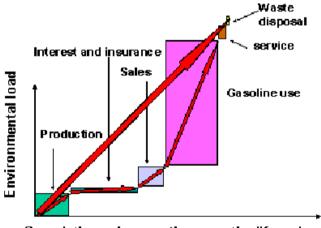

Linking

back to top

linking economy and ecology

The ratio economic added value per unit of environmental load can be plotted graphically as what we call an *E2 vector*.

The E2 vector enables benchmarking between a company's departments, between companies, between economic sectors and between different product service mixes.

Cumulative value creation over the lifecycle

Example of an E2 vector for the lifecycle of a car. The vector represents the ratio between environmental load and economic value.

Product Service Systems that create more value at a lower environmental load contribute to unlinking economy and ecology.
